

Employee and Organization Data Process

Maintaining Employee, Manager, Position, and Department information

Audience: HR administrators and authorized identity/Dataverse administrators

Version 1.0 | July 9, 2026

Document scope

This guide describes the approved HR Agent Sidecar data model and required business process. It distinguishes current Dataverse schema from planned application, automation, and Copilot features.

All names, dates, amounts, and identifiers in examples are fictional and intended for training.

How to use this guide

Use this guide when onboarding an Employee, changing organizational assignment, correcting reporting hierarchy, or disabling a departing Employee.

Item	Guidance
Intended audience	HR administrators and authorized identity/Dataverse administrators
System of record	Microsoft Dataverse in the HR Agent Sidecar solution
Naming convention	Business names are shown first; Dataverse logical names appear in parentheses.
Required means	The value must be present before the record can be considered process-ready. Dataverse business-required fields are also enforced by the platform or application.
Status discipline	Use the documented Status Reason transitions. Do not simulate process state with notes, record names, or ad hoc fields.

Privacy and least privilege

HR records can contain personal and financial information. Only enter data needed for the approved process. Do not place medical details, payment-card data, credentials, or unrelated sensitive information in free-text fields.

Business outcome

Every active Employee has one authoritative Dataverse User record with valid organizational relationships. Downstream approval routing and HR transactions depend on this accuracy.

Roles and responsibilities

Role	Responsibility
Identity administrator	Creates or synchronizes the Microsoft Entra ID identity and ensures the Dataverse User exists.
HR administrator	Maintains Employee ID, Hire Date, Employment Type, Manager, Position, and Department according to approved HR events.
Manager	Confirms reporting assignment and raises corrections.
Power Platform administrator	Maintains access/security configuration; does not invent HR data to make routing work.

Prerequisites

- The person's authorized identity exists and is synchronized to Dataverse.
- The correct Department and Position already exist, or approved reference-data creation has been completed.
- The Manager is an active Employee when manager approval routing is expected.

Process: onboard or activate an Employee

1. Search Dataverse Users by primary email and Employee ID. Do not create a duplicate because a display name differs.
2. Confirm identity-controlled fields such as name and email against the authoritative directory.
3. Enter or verify Employee ID, Hire Date, and Employment Type.
4. Select the Department (Business Unit) and Position using lookups.
5. Select the Manager using the standard Manager relationship.
6. Validate that the Manager relationship is not circular and that the Manager is enabled.
7. Save, reopen, and verify the organizational fields and reporting chain.
8. If the Employee will transact immediately, confirm the appropriate security role/access has been assigned through the governed access process.

Example: new Employee

Field	Example value
Employee	Avery Chen
Employee ID	E-10482
Primary email	avery.chen@example.com
Hire Date	July 20, 2026
Employment Type	Full Time
Department	Product
Position	Senior Designer
Manager	Morgan Lee
Enabled	Yes

Process: organizational change

1. Confirm the effective change and approvals in the source HR process.
2. Update Department, Position, or Manager only as authorized by the event.
3. Verify the new Manager is enabled and the relationship does not create a loop.
4. Assess in-flight Submitted requests and reports. Do not silently change an existing Approver unless the reassignment policy authorizes it.
5. Record the operational change in the approved audit/change channel; avoid duplicating narrative in unrelated HR fields.

Example: manager transfer

Avery moves from Morgan Lee to Priya Nair on August 1. Update Avery's Manager after the transfer is effective. A Time Off Request submitted to Morgan on July 29 remains assigned to Morgan unless the reassignment policy explicitly transfers it to Priya.

Process: departure or deactivation

1. Confirm the authorized termination/deactivation event.
2. Review outstanding requests, expense reports, and required handoffs before disabling access.
3. Reassign outstanding approval responsibility through the governed process.
4. Disable the User through the approved identity/Dataverse administration process; do not delete the Employee record.
5. Retain historical relationships and HR transactions according to policy.

Validation and exception rules

Condition	Required action
Duplicate email or Employee ID	Stop. Determine the authoritative User record; merge/correct through administration rather than creating another Employee.
Manager is disabled	Select the valid acting/permanent Manager according to policy before approval-dependent transactions are submitted.
Circular hierarchy	Stop and correct the Manager chain. An Employee cannot manage themselves directly or indirectly.
Position or Department missing	Use the governed reference-data process. Do not type the value into notes or create an unapproved duplicate.
Contractor without	Document and approve the routing exception before allowing

Condition	Required action
Manager	manager-approved transactions.

Completion checklist

- One User record; no duplicate.
- Employee ID, Hire Date, and Employment Type verified.
- Department and Position use approved lookups.
- Manager chain is valid.
- Access is appropriate for the Employee's duties.
