

HR AGENT SIDECAR

Solution and Entity Guide

Purpose, ownership, relationships, and correct use of the HR data model

Audience: HR administrators, managers, app makers, support teams, and auditors

Version 1.0 | July 9, 2026

Document scope

This guide describes the approved HR Agent Sidecar data model and required business process. It distinguishes current Dataverse schema from planned application, automation, and Copilot features.

All names, dates, amounts, and identifiers in examples are fictional and intended for training.

How to use this guide

Use this guide to understand what each business entity represents, when it should be used, and how records relate. Process-specific data-entry instructions are provided in the companion guides.

Item	Guidance
Intended audience	HR administrators, managers, app makers, support teams, and auditors
System of record	Microsoft Dataverse in the HR Agent Sidecar solution
Naming convention	Business names are shown first; Dataverse logical names appear in parentheses.
Required means	The value must be present before the record can be considered process-ready. Dataverse business-required fields are also enforced by the platform or application.
Status discipline	Use the documented Status Reason transitions. Do not simulate process state with notes, record names, or ad hoc fields.

Privacy and least privilege

HR records can contain personal and financial information. Only enter data needed for the approved process. Do not place medical details, payment-card data, credentials, or unrelated sensitive information in free-text fields.

Solution purpose

HR Agent Sidecar is a dedicated Dataverse solution for foundational employee organization data, time off, expense reimbursement, and benefits. It reuses standard Dataverse entities for Employee, Position, and Department, then adds seven HR-specific custom entities. The target experience is a Model-driven App with a contextual Copilot Studio side pane.

Implementation status

The Dataverse schema and unpacked solution source are implemented and validated. Model-driven App navigation/forms, security roles, Power Automate approval flows, and the Copilot side pane are planned solution components and must not be represented to users as active until deployed and tested.

Core design principles

- One business fact has one authoritative home. Example: reporting Manager belongs on Employee, not copied into every request.
- Reuse Dataverse platform entities and lifecycle columns instead of creating parallel employee, department, position, currency, owner, or status structures.
- Personal HR records are user-owned and require least-privilege access. Reference data is organization-owned.
- Approvals use Status Reason plus Approver, Submitted On, Decided On, and Decision Comment—not free-text conventions.
- Money values use Dataverse currency behavior. Receipt files belong on Expense Lines.

Entity catalog

Entity	Type / ownership	Purpose	How it is used
Employee (systemuser)	OOB, augmented	Worker identity and organizational assignment. Stores Employee ID, name, email, phone, Manager, Position, Department, Hire Date, Employment Type, and enabled state.	Referenced by personal HR records; synchronized identity remains governed by Entra ID/Dataverse user administration.
Position (position)	OOB	Defines an organizational role and optional parent Position.	Assigned to Employees; supports position hierarchy reporting.
Department (businessunit)	OOB	Defines organizational units, hierarchy, cost center, and division.	Assigned to Employees and used by Dataverse security/ownership.
Time Off Type (maftagsc_timeofftype)	Custom, organization-owned	Defines a leave category, code, default annual hours, and whether approval is required.	Reference data used by balances and requests.
Time Off Balance (maftagsc_timeoffbalance)	Custom, user-owned	Tracks allocated, pending, and used hours for one Employee, Time Off Type, and calendar year.	Maintained by HR and planned automation as requests move through approval.
Time Off Request (maftagsc_timeoffrequest)	Custom, user-owned	Captures requested dates/hours, reason, Employee, Time Off Type, Approver, and decision audit details.	Submitted by an Employee and normally decided by the Employee's Manager.
Expense Report (maftagsc_expensereport)	Custom, user-owned	Groups reimbursement lines under a business purpose, report date, Employee, total, Approver, and approval status.	Submitted as one approval package; total should equal approved line amounts.
Expense Line	Custom, user-	Captures one dated	Must belong to one

Entity	Type / ownership	Purpose	How it is used
(maftagsc_expen neline)	owned	merchant transaction, category, amount, description, and one receipt file.	Expense Report.
Benefit Plan (maftagsc_benef itplan)	Custom, organization- owned	Defines plan code, provider, category, coverage availability, and employee/employer cost.	Reference data selected by Benefit Enrollments.
Benefit Enrollment (maftagsc_benef itenrollment)	Custom, user- owned	Records an Employee's selected plan, coverage level/dates, election date, and employee contribution.	No approval is required in the approved base process.

Relationship map

Parent / reference	Child / transaction	Cardinality and rule
Employee	Time Off Balance	One Employee can have many balances; each balance requires exactly one Employee.
Time Off Type	Time Off Balance	One Type can have many balances; each balance requires exactly one Type.
Employee	Time Off Request	One Employee can have many requests; each request requires one Employee.
Time Off Type	Time Off Request	One Type can have many requests; each request requires one Type.
Employee (Approver)	Time Off Request	Optional while Draft; populated for submitted requests when approval is required.
Employee	Expense Report	One Employee can have many reports; each report requires one Employee.

Parent / reference	Child / transaction	Cardinality and rule
Employee (Approver)	Expense Report	Optional while Draft; populated on submission.
Expense Report	Expense Line	One report contains one or more lines; every line requires a report.
Employee	Benefit Enrollment	One Employee can have many enrollments; each enrollment requires one Employee.
Benefit Plan	Benefit Enrollment	One Plan can have many enrollments; each enrollment requires one Plan.

Entity usage details

Employee, Position, and Department

These are standard Dataverse entities. Employee is the person record used for HR transactions. Manager is the Employee referenced by the standard reporting relationship. Position is a reusable role; Department is a Business Unit and also participates in platform security.

Do not duplicate

Do not create a second Employee, Position, Department, Manager, owner, currency, or lifecycle entity. Correct the authoritative OOB record or relationship.

Time Off entities

Time Off Type is reference data. Time Off Balance is an annual balance snapshot by Employee and Type. Time Off Request is the workflow transaction. Balance records should not be used as requests, and requests should not be used as balances.

Expense entities

Expense Report is the approval header. Expense Line is the itemized transaction and receipt location. A report total is meaningful only when all lines are complete and valid.

Benefits entities

Benefit Plan defines what the organization offers. Benefit Enrollment records what an Employee selected. Editing a Plan does not automatically rewrite historical Enrollments; effective dates preserve meaning over time.

Lifecycle reference

Status Reason	Meaning	Permitted next status
Time Off Request: Draft	Employee or HR is preparing the request.	Submitted or Cancelled
Time Off Request: Submitted	Request is awaiting decision.	Approved, Rejected, or Cancelled
Expense Report: Draft	Header and lines are being assembled.	Submitted or Cancelled
Expense Report: Submitted	Report is locked for manager review.	Approved, Rejected, or Cancelled
Expense Report: Approved	Manager approved reimbursement.	Paid
Benefit Enrollment: Active	Coverage is current or scheduled.	Waived or Ended

Data quality and audit expectations

- Use stable codes for Time Off Types and Benefit Plans.
- Use Employee lookups—not names typed into notes—to identify people.
- Record dates in the field intended for the business event; Created On is not a substitute for Submitted On or Elected On.
- Do not overwrite a decided request/report to recycle it. Create a new transaction or use the documented cancellation path.
- Decision comments should explain exceptions and rejections without including unnecessary personal details.
- Retain receipts according to organizational policy; never upload payment-card numbers or unrelated files.

Rich cross-process example

Avery Chen is an active full-time Employee in the Product Department, assigned to the Senior Designer Position, and reports to Morgan Lee. Avery has an annual Vacation balance, submits a three-day Time Off Request, files an Expense Report after a customer workshop, and elects a Medical Benefit Plan. Each transaction references Avery's single Employee record; manager

routing derives from the Manager relationship; Department and Position are not copied into every transaction.

Business event	Correct record(s)	Key result
Annual vacation setup	One Time Off Balance for Avery + Vacation + 2026	Allocated, pending, and used hours remain traceable.
Vacation request	One Time Off Request	Approval and decision history are independent of the balance snapshot.
Workshop reimbursement	One Expense Report + three Expense Lines	One manager decision covers itemized transactions and receipts.
Medical election	One Benefit Enrollment linked to the active Medical Plan	Coverage dates and contribution reflect Avery's election.

Support and escalation

When data appears inconsistent, capture the record URL, entity name, record ID, current Status Reason, and a concise description. Do not copy sensitive field contents into email or chat. Escalate security concerns immediately to the Power Platform/HR data owner.
